FEATURE SELECTION

Cigdem Beyan
A. Y. 2025/2026

FEATURE SELECTION

- The process of selecting the input variable to your model by using only relevant data and getting rid of “noise” in data.
- Because, the noisy (irrelevant) attributes can mislead your model, thus decrease its performance.

All Features

Feature Selection

Final Features

FEATURE SELECTION

- High dimensional data suffers from: *Curse of Dimensionality*
- Observations in a high-dimensional space are more sparse and less representative than those in a low-dimensional space.
- Using feature selection, we can optimize our model in several ways:
 - Prevent learning from noise (overfitting)
 - Improved performance, e.g., accuracy
 - Reduce training time (more features, typically means more training time)

FEATURE SELECTION METHODS

FEATURE SELECTION METHODS

FEATURE SELECTION METHODS

FORWARD FEATURE SELECTION

- An **iterative method** in which we start with having **a single feature** in the model.
- In each iteration, we keep **adding the feature which improves our model the most**, till an addition of a new variable **does not improve the performance of the model**.

FORWARD FEATURE SELECTION – ITERATION 1

FORWARD FEATURE SELECTION – ITERATION 1

FORWARD FEATURE SELECTION-ITERATION 2

FORWARD FEATURE SELECTION-ITERATION 2

if: $\text{performance}(f5) \ll \text{performance}(f5, \text{new})$ continue iteration, otherwise stop!

FORWARD FEATURE SELECTION

BACKWARD FEATURE ELIMINATION

- An **iterative method** in which we start with **all features**, and we remove the **least significant feature** at each iteration such that removing it increases (rarely not changes) the performance of the model. We repeat this until **no improvement is observed on removal of features**.
